Although well known in the west this is a poorly worked area and this species is most certainly under recorded. Note the few records from Rubondo Island NP where it may well be resident.

The few records from Ruaha NP and the Ruaha Gorge suggest post breeding dispersal and wanderings as do those around Kilimanjaro and the upper reaches of the Pangani Valley.

The breeding season record from the Pangani is of a displaying bird in December 1997 that was actually interacting with an adult Southern Banded Snake Eagle. It is unlikley that it stayed to breed.
